In chemistry, an ester is a chemical compound derived from an acid (organic or inorganic) in which at least one -OH (hydroxyl) group is replaced by an -O-alkyl group. Usually, esters are derived from a carboxylic acid and an alcohol. Glycerides, which are fatty acid esters of glycerol, are important esters in biology, being one of the main classes of lipids, and making up the bulk of ...

Pragmatism is a philosophical tradition that began in the United States around 1870. Its origins are often attributed to the philosophers Charles Sanders Peirce, William James, and John Dewey. Peirce later described it in his pragmatic maxim: "Consider the practical effects of the objects of your conception. Then, your conception of those effects is the whole of your conception of the object."

Class Notes for Environmental Geochemistry. To do this problem you simply calculate the activity of Al^{3+} in equilibrium with gibbsite at each pH value and then use the equilibrium reactions linking $Al(OH)_3$ with Al^{3+} to calculate the activities of each $Al(OH)_3$ species. The sum of all the molalities of all these Al species would be the solubility of gibbsite at each pH point.

In comments under the highly upvoted answer by @Dan H, mention is made of the powerset() recipe in the itertools documentation—including one by Dan himself. However, so far no one has

posted it as an answer. Since it's probably one of the better if not the best approach to the problem—and given a little encouragement from another commenter, it's shown below.
