The harmonic mean is based on the sum of inverses divided into the count of terms in the sum for the inverses. In the context of the Tukey HSD test, the harmonic mean is for the M_i and M_j terms in the numerator of the preceding expression. For a balanced ANOVA design with the same number of observations for each factor level, the harmonic mean has the same value as the arithmetic mean.

We argue that individuals monitor and evaluate attainment and maintenance goals differently. Attainment goals feature a salient current-end state discrepancy that is processed more than the corresponding match for maintenance goals. For maintenance goals, for which a salient discrepancy is absent, contextual influences on goal success/failure receive more processing than for attainment goals.
