We have observed that an increase in the tension of a string causes an increase in the velocity that waves travel on the string. In this activity we will examine the precise relationship between tension (T) the force applied to the string, the wave speed ( $v_w$ ) and the linear mass density of the string ( $\mu = m/L$  which is measured in kg/m).

The above example illustrates how to use the wave equation to solve mathematical problems. It also illustrates the principle that wave speed is dependent upon medium properties and independent of wave properties. Even though the wave speed is calculated by multiplying wavelength by frequency, an alteration in wavelength does not affect wave speed.

It's always a good idea to drive without changing speed and without competing with other drivers for bits of headway. I'd always assumed that the reasons were philosophical rather than practical (i.e. try to be a calm, nice person.)

Clean AC is ubiquitous, so some electrical devices are designed with it as a starting assumption. Devices That Care About AC Power Quality. A classic example of a device that starts with such an assumption is an analog audio power amplifier designed in or before the early 1970s, or a more modern piece designed along the same lines. Linear regulation throws off too much heat to be practical in ...

The speed at which light waves propagate in vacuum is independent both of the motion of the wave source and of the inertial frame of reference of the observer. This invariance of the speed of light was postulated by Einstein in 1905, after being motivated by Maxwell's theory of electromagnetism and the lack of evidence for the luminiferous aether; it has since been consistently confirmed by ...

Tidal Wave vs Tsunami. Most people assume that there is no difference between a tidal wave and a tsunami, and often use the words interchangeably. This is inaccurate, and while both of the waves carry the power of destruction, the greatest difference is how each is born.

In fact, it is this equation and the Doppler effect that are behind the "speed trap guns" used by police forces. "Light" entering the gun has its frequency measured against a set value. The difference in the two frequencies is fed into a modified form of the above equation and a speed is calculated. While water and sound waves don't have constant speeds we've said that light does.
