Figure 1. Triglyceride Broken Down into a Monoglyceride A triglyceride molecule (a) breaks down into a monoglyceride (b). Lipid metabolism begins in the intestine where ingested triglycerides are broken down into smaller chain fatty acids and subsequently into monoglyceride molecules (see Figure 1b) by pancreatic lipases, enzymes that break down fats after they are emulsified by bile salts.

### **24.3 Lipid Metabolism - Anatomy and Physiology**

Introduction to the Anatomy of the Heart Valves: Four valves maintain the unidirectional flow of blood through the heart. The valves are located between the atria and ventricles and in the two arteries that empty blood from the ventricles.
