I have an associative array in the form key => value where key is a numerical value, however it is not a sequential numerical value. The key is actually an ID number and the value is a count. This is fine for most instances, however I want a function that gets the human-readable name of the array and uses that for the key, without changing the value.

This is a chronic problem with large Identity Management systems attempting to glue together heterogeneous systems. Invariably, you'll be limited to the lowest common denominator, which all too often is an 8-character ASCII-alpha-numeric limit thanks to some (probably legacy) Unix-like system somewhere in the bowels of the datacenter.
